Over-the-scope clip closure of an iatrogenic gastro-colic fistula following maldeployment of a lumen-apposing metal stent

A 44-year-old man with a 3-month history of necrotizing pancreatitis was referred for endoscopic ultrasound (EUS)-guided drainage of infected 12×5 cm symptomatic walled-off necrosis (WON) [1] (►Fig. 1 a). At EUS, a large partially cystic/solid lesion, interpreted as the WON, was identified. A 20-mm lumen-apposing metal stent (LAMS; Hot AXIOS, Boston Scientific, Marlborough, Massachusetts, USA) and plastic pigtail stent were deployed through the posterior gastric wall. The patient was well following the procedure. However, computed tomography (CT) revealed that the LAMS had been incorrectly deployed into the colon (►Fig. 2), and the WON had spontaneously improved (3×2 cm) (►Fig. 1 b). We planned to remove the LAMS endoscopically and close the gastro-colic fistula (GCF) by over-the-scope-clips (OTSCs) [2, 3] (►Video 1). Colonic cleansing necessitated a nasojejunal tube to bypass the GCF.

Simultaneous upper and lower gastro-intestinal endoscopy were performed under general anesthesia. The colonoscope, loaded with a 14-mm OTSC (Ovesco, Tübingen, Germany), was inserted to

►Fig. 1 Computed tomography. a Symptomatic walled-off necrosis (WON). b Spontaneously improved WON.

the LAMS at the splenic flexure. The LAMS was removed with the gastroscope. The colonic defect was closed with the OTSC using twin-grasping forceps tissue apposition (►Fig. 3), followed by similar closure of the gastric defect with two 12-mm OTSCs. Successful closure was confirmed endoscopically and radiologically with indigo carmine dye and contrast, respectively (►Fig. 4). Although the patient developed some delayed localized pain and peritonism 48 hours

after oral intake, repeat contrast CT showed no leakage (►Fig. 5 a). Symptoms settled conservatively with antibiotics and temporary intravenous nutrition. The patient was discharged 10 days after the procedure, with a pre-discharge contrast meal re-confirming no leakage (►Fig. 5 b).

To the best of our knowledge, this is the first case of successful OTSC closure of an acute GCF caused by a maldeployed LAMS, confirming the role of OTSCs in
