The patient is a 55-year-old woman status post two mitral clips with a severely dilated left atrium and persistent severe mitral regurgitation. During a follow-up, an attempt was made to examine the proximal coronary arteries by two-dimensional transthoracic echocardiography¹⁻³ (► **Videos 1-4**).

the same patient. AO, aorta; LA, left atrium; PR, pulmonary regurgitation; PV, pulmonary valve; RAA, right atrial appendage. Online content including video sequences viewable at: www.thieme-connect.com/ejournals/html/doi/10.1055/s-0037-1604211.

Videos 1-4

The left main (LMC), proximal left anterior descending (LAD), and left circumflex (CX) coronary arteries are well seen in B-mode (► **Videos 1, 2**) and with color Doppler (► **Video 3**). No significant stenosis is noted in the visualized vessels in B-mode. Color Doppler signals are also laminar with no flow aliasing or turbulence consistent with no obstruction. ► **Video 4** shows normal right coronary artery (RCA) orifice viewed using the right parasternal examination approach in
