Small intestine grasped by over-the-scope-clip during attempt to close an iatrogenic colonic perforation

The over-the-scope-clip (OTSC; Ovesco, Tübingen, Germany) has been developed for the closure of intestinal defects [1,2]. We report on the case of a misplaced OTSC, which grasped the small intestine through an iatrogenic colonic perforation. A 78-year-old woman underwent follow-up colonoscopy after right-sided colon re-

section, which was performed for colon carcinoma. In the transverse colon, a flat polyp was detected. After performing the lifting procedure, a polypectomy was carried out using a snare. Immediately after polypectomy, a transmural iatrogenic perforation was observed (▶ Fig. 1 a).

The investigator immediately tried to close the perforation by applying an OTSC, using the standard procedure that involves suctioning the defect to ensure correct clip positioning. After releasing the OTSC, the small intestine was seen in the colonic lumen, with the clip fixed around it (▶ Fig. 1 b, ▶ Video 1).

The patient was transferred to the surgical department for laparotomy 2 hours after the perforation event. During laparotomy, the livid color of the jejunum wall could be seen where the OTSC had grasped the small intestine. The intestinal lumen was occluded completely (▶ Fig. 2 a). The OTSC was released using a side cutter,

and the incarcerated small intestine recovered well within minutes (► Fig. 2b). No transmural defect of the wall was seen, and therefore resection or suturing was not required. In the transverse colon, a defect of 3 cm in diameter was found (► Fig. 3), relating to the original colonic perforation; the colon segment was resected.

We conclude that use of the OTSC closure technique is limited by the size of the intestinal defect. When a large perforation

occurs into the abdominal cavity, caution is required to avoid suctioning the small intestine into the OTSC. Using a twin grasper might be a safer placing technique for OTSCs in this case. Surgical treatment should take place without delay if there is any doubt about the adequacy of a leakage closure, in order to prevent further severe complications.
