Fig. 1S
Fig. 1S FACS analysis of intracellular IL-1α (A), TNF-α (B) and IL-12 (C) accumulation at single cell level in non-infected and *Listeria*-infected BMMΦ in the absence and presence of 30 µg/mL of **EPs® 7630** after 6 h. LPS (10 ng/mL) + IFN-γ (100 U/mL) stimulated cells served as positive and untreated cells as negative controls. Shown is the percentage of positive cells. The values (mean ± s.d) are derived from three independent experiments; * P < 0.05 vs. control. The vehicle (medium and DMSO, respectively) did not affect the cytokine productions (data not shown).

Fig. 2S Expression of CD40 in non-infected and in *Listeria*-infected BMMΦ treated with 30, 20, 10, 5 and 1 µg/mL of **EPs® 7630**. LPS (10 ng/L) + IFN-γ (100 U/mL) treated non-infected cells served as positive and untreated cells as negative controls. The data shown present one out of two separate experiments with similar results. The numbers given represent the median fluorescence intensities. The vehicle (medium and DMSO, respectively) did not affect the expressions (data not shown).
