Supplementary Figure to Hildemann et al. “Fractalkine promotes platelet activation and vascular dysfunction in congestive heart failure” (Thromb Haemost 2014; 111.4)

Suppl. Figure 1: Fractalkine and clopidogrel-responsiveness in healthy rats. A threshold dose of clopidogrel was selected by treating healthy Wistar rats with different dosages of clopidogrel (0.1-20 mg/kg bidaily) and the efficacy was tested by determination of the platelet-reactivity index (PRI). The dose of 5mg/kg twice daily emerged as a suitable threshold dose achieving sufficient P2Y\textsubscript{12} inhibition in healthy animals (n=4).
