Supplemental Figure 1 Correlations between haematocrit and TEM clotting time (CT). (A, B) Correlations between haematocrit (pooling values from sea level and day 7 at 5200 m) and INTEM CT (A) and EXTEM CT (B) on Apex 4.

Supplemental Figure 2 Thromboelastometry measurements of clot formation time (CFT). Whole blood was analysed using thromboelastometry on Apex 4 (A, C) and Apex 2 (B, D) using INTEM (A, B) or EXTEM (C, D). Clot formation time (CFT) is the time taken from a thromboelastometry trace amplitude of 2 mm above baseline to 20 mm above baseline. Data are mean (horizontal bars) +/- SEM. *p < 0.05 using paired t-tests corrected for multiple comparisons.
