**Fig. 1S** IC<sub>50</sub> isobolograms of three substances against H460 cells. The IC<sub>50</sub> value of PTX in a mixture (PTX + CBDCA) (molar ratio 1:2) is expressed as 1.0 on the Y-axis of the isobologram, while that of NOB or the Shiikuwasha extract alone is expressed as 1.0 on the X-axis.
**Fig. 2S** Cell cycle analyses of H460 cells. Cells were treated with 0.5% DMSO, NOB, PTX + CBDCA, or PTX + CBDCA and NOB for 24 h. The percentages in the graphs represent the rates of cells of each phase to the total cells.
