ABSTRACT
Background and study aims Endoscopic retrograde cholangiopancreatography (ERCP) in patients with a preexisting duodenal stent is particularly challenging and has a low success rate. Endoscopic ultrasound (EUS)-guided biliary drainage (EUS-BD) has been increasingly used as an alternative to percutaneous transhepatic biliary drainage after failed ERCP. EUS-guided choledochoduodenostomy (EUS-CD) and EUS-guided hepaticogastrostomy (EUS-HGS) have been reported to have similar efficacity. Recently, a novel dedicated fully-covered lumen-apposing metal stent (LAMS) has been developed for EUS-CD (Hot AXIOS; Boston Scientific, Massachusetts, United States). It seems that this new device decreases the morbidity of EUS-CD. We present a case in which EUS-CD with LAMS through an uncovered metal duodenal stent was used successfully.

Case report
A 56-year-old man with recent abdominal pain and postprandial vomiting underwent a computed tomography (CT) scan, which showed an enlarged tumor of the pancreatic head with duodenal obstruction. Endoscopic ultrasound fine-needle aspiration (EUS-FNA) confirmed the diagnosis of pancreatic adenocarcinoma. At that time, no dilatation of the main bile duct was seen, the liver function test was normal, and no biliary stent was inserted. For a complete duodenal obstruction, an uncovered metal stent duodenal stent was placed.

Two months later, the patient presented with abdominal pain and jaundice. Laboratory tests showed elevated liver function test results: ALT 229 U/L (5–45 U/L), AST 181 U/L (5–35 U/L), PAL 540 U/L (30–110 U/L), yGT 6329 U/L (7–50 U/L), Bilirubin 268 μmol/L (0–20.5 μmol/L). A computed tomography scan revealed biliary tree dilatation with extrinsic pancreatic compression (Fig. 1).

First, ERCP failed to achieve biliary drainage because of an inability to cannulate the papilla due to tumor infiltration. Endoscopic ultrasound-guided hepaticogastrostomy (EUS-HGS) was not attempted because the left intrahepatic bile ducts were minimally dilated (3 mm). However, the common bile duct (CBD) was largely dilated (20 mm). A Hot AXIOS device with a stent of 8 × 6 mm was advanced through the uncovered metal stent. Pure cut electrocautery current was then applied, allowing the device to reach the CBD. Next, the distal flange was opened (Fig. 2) and retracted towards the EUS transducer, and once a biliary and bulbar tissue apposition had been noted, the proximal flange was released (Fig. 3). Good
drainage of purulent bile was observed (▶ Video 1) (▶ Fig. 4, ▶ Fig. 5) and no complications occurred during the procedure and 6 months after.

Endoscopic ultrasound guided biliary drainage (EUS-BD) has been increasingly used as an alternative to percutaneous transhepatic biliary drainage after failed ERCP [2, 3]. EUS-CD and EUS-HGS have been reported to have similar efficacy [4]. It seems that this new device decreases the morbidity of EUS-CD [5].

**Conclusion**

This is the first reported case of EUS-CD through a duodenal metal stent. Failed ERCP after duodenal stent placement is a frequent situation faced by endoscopists during the progression of advanced pancreatic cancer, and ERCP can be easily done using this method.
