Pharyngoesophageal perforation during introduction of an echoendoscope treated with a fully covered self-expandable metal stent

A 69-year-old woman with a history of renal transplantation was investigated for biliary duct dilation. She was receiving treatment with prednisone and tacrolimus. Echoendoscopy was performed with a radial scope (Olympus GF-UE160) with the patient under conscious sedation. During introduction of the endoscope, perforation was observed in the pharyngoesophageal area. The decision was made to place a fully covered self-expandable metal stent (23×12 mm; Wallflex, Boston Scientific), completely covering the defect in the oropharynx (▶ Fig. 1). The patient was intubated first to avoid the discomfort caused by the stent, and was then moved to the resuscitation unit. The stent was removed 5 days later with apparent resolution of the perforation. Computed tomography (CT) and a barium esophagogram confirmed resolution of the defect (▶ Fig. 2; ▶ Fig. 3). A small fluid collection at the mediastinum without air bubbles, shown on CT (▶ Fig. 2), was treated conservatively with antibiotics (▶ Video 1). The patient recovered completely with no symptoms of dysphagia.

Iatrogenic oropharyngeal perforation is a rare complication of echoendoscopy, occurring in 0.03% of explorations [1,2]. The rate is probably higher with echoendoscopes and duodenoscopes because of their rigidity and lateral or oblique viewing. In the oropharynx, it is not possi-

▶ Fig. 1 A fully covered self-expandable metal stent was placed at the site of the pharyngoesophageal perforation.

▶ Video 1 Iatrogenic pharyngoesophageal perforation treated with a fully covered self-expandable metal stent and orotracheal intubation.

▶ Fig. 2 A barium esophagogram showed no perforation after stent retrieval.

▶ Fig. 3 Computed tomography showed a small collection at the mediastinum, with no air bubbles.

ble to close a perforation with either normal or over-the-scope clips. Other cases have been published in which resolution of the defect in 3 days was reported [3, 4], but because our patient was being treated with prednisone, we preferred to delay removal of the stent.
