Small-caliber plastic stent for endoscopic ultrasound-guided drainage of a non-dilated pancreatic duct

Endoscopic ultrasound (EUS)-guided pancreatic drainage is increasingly utilized in cases where endoscopic retrograde cholangiopancreatography (ERCP) is not possible [1–3]. EUS-guided pancreatic drainage for a non-dilated pancreatic duct (PD) not only poses technical challenges but also increases the risk of procedure-related pancreatitis as well as stent-induced ductal injury. A small-caliber stent might be suitable for a non-dilated PD to prevent ductal injury and upstream main duct obstruction, but there has been no report on a dedicated 5-Fr EUS-guided pancreatic drainage stent. Herein we present a newly designed 5-Fr plastic stent for EUS-guided pancreatic drainage (Through & Pass Type IT; Gadelius Medical, Tokyo, Japan) (▶Fig. 1), which is a thinner type of a previously reported stent [4].

A 75-year-old woman with a history of pancreatoduodenectomy for intraductal papillary mucinous neoplasm was hospitalized with a pancreatic fluid collection (▶Fig. 2). The fluid collection did not subside after percutaneous drainage, and therefore we decided to perform EUS-guided pancreatic drainage (▶Video 1). Under EUS guidance, we punctured the non-dilated main PD with a 19-gauge needle and inserted a 0.025-inch guidewire (▶Fig. 3a). The needle tract was dilated using an ultratapered mechanical dilator (ES dilator; Zeon Medical, Tokyo, Japan) and a 4-mm-wide balloon dilator (REN; Kaneka, Osaka, Japan). Using a double-lumen catheter (Uneven Double Lumen Cannula; Piolax Medical Devices, Kanagawa, Japan), we successfully passed a 0.025-inch hydrophilic guidewire into the jejunum and additionally inserted a 0.035-inch guidewire to stabilize the scope position (“double guidewire technique”) (▶Fig. 3b) [5]. After dilation of the pancreaticojejunostomy anastomosis using the balloon dilator, a 5-Fr stent was readily positioned from the jejunum to the stomach (▶Fig. 3c). The postprocedural course was uneventful and the percutaneous drain was successfully removed. A follow-up CT scan 4 months later revealed the disappearance of the fluid collection without upstream ductal dilation. Our new 5-Fr plastic stent was feasible in the EUS-guided drainage of a non-dilated PD.
