A novel endoscopic suturing device after endoscopic full-thickness resection of gastric submucosal tumor

Endoscopic full-thickness resection (EFTR) is a minimally invasive technique that has shown promising efficacy in the resection of gastrointestinal submucosal tumors. The key to a successful EFTR procedure is the complete closure of the wall defect to prevent peritonitis and the need for surgical intervention [1, 2]. Here, we present a suturing technique to close a gastric wall defect after performing EFTR with Zeosuture M (Zeon Medical Co., Tokyo, Japan), a novel endoscopic suturing device (Fig. 1).

A 46-year-old man was diagnosed with a 25-mm intra-growth gastric gastrointestinal stromal tumor (GIST) in the fornix (Fig. 2) (Video 1). The EFTR was performed with a ring-thread counter traction (Fig. 3). The endoscopic closure of the wall defect was performed using Zeosuture M through a single-channel endoscope. First, one end of the front arm was inserted into the edge of the serosal side, and the rear arm with the puncture needle was moved forward and penetrated the full thickness of the resected margin. When the absorbent thread and the connector joined the front arm and the punct-
ture needle, they were pulled out from the gastric mucosa. Then the rear arm was rotated to the opposite side. This arm was placed at the resection opening and the puncture needle was passed through the full thickness. Next, the full thickness of both resected margins of the resection opening was tied and tension was applied to the thread by Zee-tieupper S (Zeon Medical). Then, ligation was performed. Finally, the thread was cut with Hookcutter MI (Zeon Medical).

In a similar manner, the wall defect and post-EFTR ulcer floor were successfully closed by three-stitch sutures at an approximately 5-mm interval (Fig. 4). Follow-up endoscopy on post-operative day 14 revealed the sustained closure of the wall defect (Fig. 5).

Hence, Zeosuture M is a novel full-thickness suturing device and can be a reliable option for suturing the wall defect after EFTR.
