In recent years, the spectrum of endoscopic colorectal resection methods for mucosal carcinomas and scar lesions that show no lifting sign has been extended by the use of full-thickness resection (FTR) [1]. We report a case of resection of a right colon residual scar, using an FTR device (FTRD; Ovesco Endoscopy, Tübingen, Germany), with unconventional access through a cutaneous stoma.

An 81-year-old man had previously undergone a Hartmann resection for colorectal adenocarcinoma, with the creation of a definitive terminal stoma. He later underwent en bloc endoscopic mucosal resection (EMR) of a 7-mm polypoid sessile lesion (type 0-Ia Paris classification) in the right ascending colon. The histological specimen showed intramucosal adenocarcinoma, but the vertical extension of the neoplastic verge was nonevaluable and consequently FTR of the residual scar was scheduled.

First, we accessed the scar through the stoma with a 13.2-mm caliber colonscope and the lesion was marked with an electrocauterity probe (▶ Fig. 1). It was anticipated that it would not be possible to pass the scope fitted with the full-thickness resection device through the narrow opening of the stoma. Therefore pneumatic dilation of the stoma with an 20-mm esophageal balloon catheter was performed (▶ Fig. 2).

An 11.6-mm caliber gastroscope was required to obtain access through the stoma with the FTR device. When the marked lesion was reached, it was resected with the assistance of the grasper forceps (▶ Video 1).

The scope with the cap was withdrawn through the stoma without any problem. The subsequent evaluation showed correct placement of the clip and complete closure of the wall defect (▶ Fig. 3). The lesion was later fixed in formaldehyde, oriented on a cork base for histological assessment.

To the best of our knowledge, this is the first case of a FTR procedure performed by means of access through a stoma, in a nonsurgical setting. The larger caliber of the FTR device and the nature of the
access point raise technical issues in this type of procedure that require adequate preparation and availability of resources.

ENDOSCOPY E-VIDEOS
https://eref.thieme.de/e-videos

Endoscopy E-Videos is an open access online section, reporting on interesting cases and new techniques in gastroenterological endoscopy. All papers include a high quality video and all contributions are freely accessible online. Processing charges apply (currently EUR 375), discounts and waivers acc. to HINARI are available.

This section has its own submission website at https://mc.manuscriptcentral.com/e-videos
