#### Abstract

A flexible stereoselective and convergent cum divergent approach to the synthesis of two 13-membered macrolides through a common skeleton present in their structure is described featuring two different routes, with good overall yield. The key synthetic reactions utilized include Keck allylation, Evans asymmetric methylation, Grubbs metathesis, and Julia-Kocienski olefination.

Key words macrolides, melearoride A, PF1163B, Julia-Kocienski olefination, ring-closing metathesis

Marine-derived fungi receive significant attention as natural sources of drugs because of their impressive biological activities. ${ }^{1}$ During recent decades, the pharmacology of antimycotics has advanced significantly, although common
invasive fungal infections are still believed to have a high mortality rate. ${ }^{2,3}$ Melearoride-A (1), a novel 13-membered macrolide isolated from marine-derived fungus Penicillium meleagrinum var. viridiflavum by Koyama and co-workers in 2016 has been demonstrated to show synergic effects with fluconazole against azole-resistant Candida albicans. ${ }^{4}$ The structure of 1 was elucidated from spectroscopic data (NMR, MS, IR). PF1163B (2), another 13-membered macrolide (Figure 1) was isolated along with PF1163A as new antifungal antibiotics from the Penicillium $s p$., by Sasaki and co-workers. ${ }^{5,6}$ The structure of PF1163B has been deduced by chemical and X-ray crystallographic analyses, and was observed to be the first known inhibitor of ERG25p, a C-4 methyl oxidase. ${ }^{7}$ The antifungal activity of PF1163A was found to be four times higher than that of PF1163B, despite possessing a near identical skeleton except for the presence of an additional hydroxyl group in the side chain of PF1163A. The two macrolides, melearoride-A and PF1163B, are structurally and stereochemically similar and differ in alkyl chain appendage; wherein the phenolic group of the amino acid fragment l-tyrosine is coupled with a different alkyl chain.

The impressive biological properties and structural architecture of these macrolides have stimulated several synthetic groups and culminated in the synthesis of individual members of this class. To our knowledge, there is only one synthesis on melearoride $A^{8}$ and three reported synthetic routes for PF1163B. ${ }^{\text {9-11 }}$

In a continuation of our interest in the total synthesis of biologically active natural products, ${ }^{12}$ we report herein the stereoselective synthesis of two 13-membered macrolides, melearoride-A and PF1163B, by following a similar strategy and by two different approaches.

Our retrosynthetic analysis (Scheme 1) revealed a common macrocyclic core 8, which can be alkylated with 1-bromo-3-methylbut-2-ene or a 2-haloethan-1-ol derivative to furnish the corresponding alkylated ethers melearoride A and PF1163B, respectively. The macrocyclic framework 8 could be obtained from two key fragments, 9 and 10. While the latter can be synthesized from readily available amino acid l-tyrosine, 9 can be synthesized from commercially available $n$-hexanal through a sequence of synthetic transformations involving Keck allylation, cross-metathesis and auxil-iary-based chiral alkylation reaction.

Scheme 1 Retrosynthetic analysis for 1 and 4

Our synthetic efforts began with the synthesis of precursor building block $\mathbf{9}$ from commercially available $n$-hexanal. Initially, $n$-hexanal was subjected to Keck asymmetric allylation to afford homallylic alcohol 11 (Scheme 2). ${ }^{13}$ The TBS protected homo allylic alcohol 12, ${ }^{14}$ on ozonolysis followed by C-2 Wittig reaction, provided the unsaturated ester 13 in $85 \%$ yield over two steps. The unsaturated ester 13, on reduction with $\mathrm{NaBH}_{4}$ and $\mathrm{NiCl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ in methanol, gave saturated ester $14 .{ }^{15}$ Ester 14, on hydrolysis with $\mathrm{LiOH} \cdot \mathrm{H}_{2} \mathrm{O}$ in THF/ $\mathrm{H}_{2} \mathrm{O}(3: 1)$, afforded acid 15 , which was used for N -
acylation of (S)-4-benzyl-2-oxazolidinone in the presence of $\mathrm{Et}_{3} \mathrm{~N}$, pivaloyl chloride and LiCl in THF to give the corresponding $N$-acyl derivative 16 in $85 \%$ yield. ${ }^{16}$ Compound 16, on diastereoselective methylation with $\mathrm{CH}_{3} \mathrm{I}$ in the presence of LiHMDS as base, afforded $\mathbf{1 7}$ with a 20:1 diastereomeric ratio. Exposure of $\mathbf{1 7}$ to $\mathrm{LiBH}_{4}$ provided the primary alcohol 18, ${ }^{17}$ which, upon oxidation with Dess-Martin periodinane in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ followed by homologation using the C 1 Wittig salt in the presence of n-BuLi, provided alkene 19 in $70 \%$ yield over two steps. Finally, deprotection of the TBS protected alcohol under TBAF, THF conditions afforded secondary alcohol fragment 9 in $86 \%$ yield.

The amino acid fragment $\mathbf{1 0}$ was synthesized from commercially available l-tyrosine. Accordingly,L-tyrosine was treated with $\mathrm{SOCl}_{2}$ in methanol under reflux to provide the corresponding methyl ester 20. Boc protection followed by benzylation was achieved with $\mathrm{Boc}_{2} \mathrm{O}$ in the presence of triethylamine and then BnBr in the presence of KI and $\mathrm{K}_{2} \mathrm{CO}_{3}$ in acetone to provide 21, followed by 22, respectively. ${ }^{18}$ Ester 22, upon hydrolysis with LiOH, provided acid 23, which was subjected to N -methylation with MeI and NaH to produce the enantiomerically pure aromatic fragment $\mathbf{1 0}$ (Scheme 3). ${ }^{19}$

Scheme 3 Synthesis of 10. Reagents and conditions: (a) $\mathrm{SOCl}_{2}, \mathrm{CH}_{3} \mathrm{OH}$, reflux, $3 \mathrm{~h}, 100 \%$; (b) ( Boc$)_{2} \mathrm{O}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, r.t., overnight, $95 \%$; (c) BnBr , $\mathrm{K}_{2} \mathrm{CO}_{3}$, KI, acetone, reflux, $6 \mathrm{~h}, 96 \%$; (d) $\mathrm{LiOH} \cdot \mathrm{H}_{2} \mathrm{O}, \mathrm{THF} / \mathrm{H}_{2} \mathrm{O}(3: 1), 2 \mathrm{~h}$, $86 \%$; (e) $\mathrm{NaH}, \mathrm{CH}_{3} \mathrm{l}$, THF, $6 \mathrm{~h}, 80 \%$.

With the two key fragments in hand, we proceeded to the esterification of acid $\mathbf{1 0}$ with alcohol 9 under Yamaguchi conditions to afford ester $\mathbf{2 4}$ (Scheme 4). ${ }^{20}$ Boc deprotection with TFA afforded secondary amine, which was then acylated with pent-4-enoic acid using DIPEA / Pybop to give the corresponding acylated $\alpha, \omega$-diene 25 in $80 \%$ yield over two steps. Ring-closing metathesis of diene $\mathbf{2 5}$ was achieved in toluene under reflux to provide the requisite macrocycle containing a mixture of $(E)$ - and ( $Z$ )-diastereomers in $70 \%$ yield. Since the geometry of the olefin was not of concern, we proceeded to the one-pot reduction of the alkene and debenzylation by hydrogenation with $\mathrm{Pd}-\mathrm{C}$ in EtOAc to give the desired macrocycle $\mathbf{8}$ in $85 \%$ yield. In this synthetic route, the macrocyclic intermediate $\mathbf{8}$ was obtained from nhexanal in 17 steps with $2.7 \%$ overall yield.

An alternate strategy to ring-closing metathesis to obtain 8 was also adopted (Scheme 5). Thus, alcohol 18 was oxidized under Dess-Martin periodinane conditions to yield the corresponding aldehyde, which, on Julia-Kocienski olefination with sulfone 26 using KHMDS as base, afforded the alkene 27 as a diastereomeric mixture ( $E / Z 14: 1$ ) in $80 \%$

Scheme 4 Synthesis of 8. Reagents and conditions: (a) 2,4,6-trichlorobenzoyl chloride, $\mathrm{Et}_{3} \mathrm{~N}$, DMAP, toluene, $0^{\circ} \mathrm{C}$ to r.t., $8 \mathrm{~h}, 90 \%$; (b) TFA, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 3 \mathrm{~h}$; (c) Pent-4-enoic acid, Pybop, DIPEA, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 6 \mathrm{~h}, 80 \%$ (over two steps); (d) Grubbs' second-generation catalyst ( $10 \mathrm{~mol} \%$ ), toluene, reflux, 12 h, $70 \%$; (e) $\mathrm{H}_{2}$, $\mathrm{Pd} / \mathrm{C}$, EtOAc, r.t., $85 \%$.
yield. ${ }^{21}$ Sulfone 26 was synthesized starting with 1,4 -butanediol, which was monoprotected as the corresponding benzyl ether $\mathbf{2 8}$ and the alcohol was converted into sulfide 29 under Mitsunobu conditions on treating with 1-phenyl1 H -tetrazole-5-thiol (Scheme 6). m-CPBA oxidation of sulfide 29 afforded the required sulfone fragment $\mathbf{2 6}$ in 90\% yield. ${ }^{22}$ Deprotection of the TBS group in 27 was achieved with TBAF in THF to provide secondary alcohol 30 in $85 \%$ yield (Scheme 5). Esterification of acid $\mathbf{1 0}$ with alcohol $\mathbf{3 0}$ under Yamaguchi conditions afforded ester 31. One-pot reduction of the double bond and debenzylation was achieved with Pd-C (10\%) in EtOAc, under hydrogen to afford primary alcohol 32 in $80 \%$ yield. Then, alcohol 32 was oxidized to acid 33 using BAIB, TEMPO oxidation conditions, ${ }^{23}$ in $81 \%$ yield. Boc deprotection with TFA followed by intramolecular coupling of acid with secondary amine with DIPEA, PyBOP afforded $\mathbf{8}$ in $80 \%$ yield over two steps.

Scheme 5 Alternate approach for the synthesis of 8. Reagents and conditions: (a) DMP, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, r.t., $2 \mathrm{~h}, 76 \%$; (b) $\mathbf{2 6}, \mathrm{KHMDS}, \mathrm{THF}, 1 \mathrm{~h},-78{ }^{\circ} \mathrm{C}, 80 \%(14: 1$ E:Z ratio); (c) TBAF, THF, $0^{\circ} \mathrm{C}$ to r.t., $85 \%$; (d) 10, 2,4,6-trichlorobenzoyl chloride, Et ${ }_{3} \mathrm{~N}, \mathrm{DMAP}$, toluene, $0^{\circ} \mathrm{C}$ to r.t., $8 \mathrm{~h}, 90 \%$; (e) H , $\mathrm{Pd} / \mathrm{C}, \mathrm{EtOAC}$, r.t., $80 \%$; (f) BAIB, TEMPO, $\mathrm{CH}_{3} \mathrm{CN}, \mathrm{pH} 7$, r.t., 4 h, $81 \%$ (g) TFA, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, r.t., 3 h; (h) Pybop, DIPEA, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 6$ h, $80 \%$ (over two steps).

Scheme 6 Synthesis of 26. Reagents and conditions: (a) $\mathrm{NaH}, \mathrm{BnBr}, \mathrm{THF}$, 4 h, $85 \%$ (b) $\mathrm{PPh}_{3}$, DIAD, 1-phenyl- 1 H -tetrazole-5-thiol, THF, 8 h, $90 \%$; (c) $m$-CPBA, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 16 \mathrm{~h}, 90 \%$.

In this synthetic route we produced fragment $\mathbf{8}$ from $n$ hexanal in 16 steps in $3.4 \%$ overall yield. Finally, $O$-alkylation of phenol $\mathbf{8}$ using prenyl bromide with $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ as base and a catalytic amount of KI in DMF afforded the target molecule (-)-melearoride-A in $90 \%$ yield. ${ }^{24}$ The broad signals in the ${ }^{1} \mathrm{H}$ NMR spectrum are attributed to the presence of conformers. ${ }^{6}$ Using similar etherification conditions, 0 alkylation of $\mathbf{8}$ with 2-bromoethoxy-tert-butyldimethylsilane, followed by subsequent TBS deprotection afforded PF1163B in $87 \%$ yield over two steps (Scheme 7). The ${ }^{1} \mathrm{H}$ NMR spectroscopic data of the resulting product were found to be in accordance with previously reported data. ${ }^{11}$

Scheme 7 Synthesis of compound melearoride A (1) and PF1163B (4). Reagents and conditions: (a) $\mathrm{K}_{2} \mathrm{CO}_{3}$, KI , prenyl bromide, DMF, 4 h , reflux, 90\%; (b) (2-bromoethoxy)(tert-butyl)dimethylsilane, $\mathrm{K}_{2} \mathrm{CO}_{3}$, KI, DMF, 4 h, reflux; (c) TBAF, THF, 6 h, 83\% (over two steps).

In conclusion, we have accomplished the stereoselective total synthesis of macrolides melearoride A and PF1163B in good overall yields. For the first time, Julia-Kocienski olefination has been applied to extend the C-4 carbon chain in the synthesis of members of this family as an alternative to conventional Grubbs ring-closing metathesis. This strategy allows easy access to various analogues by varying the side chain on the aromatic amino acid fragment for further screening of antifungal and antibiotic properties.

All reagents were used as received from commercial sources unless otherwise noted. All air- and moisture-sensitive reactions were conducted under nitrogen or argon in flame-dried or oven-dried glassware with magnetic stirring. $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was stirred over $\mathrm{CaH}_{2}$ and distilled prior to use. THF was dried with Na /benzophenone and distilled prior to use. Toluene was freshly distilled from $\mathrm{CaH}_{2}$ before use. Reactions were monitored by thin-layer chromatography, using Merck silica gel 60 F254 and UV light, iodine or $p$-anisaldehyde for visualization. Column chromatography was carried out on silica gel (60-120 mesh or 100-200 mesh). Technical grade ethyl acetate and petroleum ether were used for column chromatography and were distilled prior to use. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded in $\mathrm{CDCl}_{3}$ on 300 MHz , $400 \mathrm{MHz}, 500 \mathrm{MHz}$ or 600 MHz spectrometers. Coupling constants (J) are given in Hz . Chemical shifts ( $\delta$ ) are reported in ppm downfield from TMS with use of the residual solvent peak in $\mathrm{CDCl}_{3}(\mathrm{H}: \delta=7.26$ and $\mathrm{C}: \delta=77.0 \mathrm{ppm})$ or TMS $(\delta=0.0 \mathrm{ppm})$ as internal standards. Signal patterns are indicated as follows: $s=$ singlet, $d=$ doublet, $d d=$ doublet of doublets, $\mathrm{dt}=$ doublet of triplets, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{m}=$ multiplet, $\mathrm{br}=$ broad. IR spectra were recorded with a Bruker infrared spectrophotometer and are reported in $\mathrm{cm}^{-1}$. High-resolution mass spectra (HRMS) were recorded with a Waters-TOF. Specific rotations were measured using a 1 mL cell with a 1 dm path length.
