

# Cycloaddition of Tetramethyldisiloxane to Alkynes with [Au]/TiO<sub>2</sub>

## Selected examples:

## Proposed reaction pathway:

**Significance:** TiO<sub>2</sub>-supported gold nanoparticles ([Au]/TiO<sub>2</sub>) catalyzed the oxidative cycloaddition of 1,1,3,3-tetramethyldisiloxane (TMDS) to alkynes **1** to give the corresponding cycloadducts **2** in up to 99% isolated yield (22 examples, eq. 1).

**Comment:** The authors proposed a reaction pathway for the present oxidative cycloaddition as follows (eq. 2): (1) oxidative addition of TMDS to [Au] giving H-[Au]-Me<sub>2</sub>SiOSiHMe<sub>2</sub> (**A**); (2) insertion of alkynes **1** into the Si-Au bond forming gold adducts **B**; (3) intramolecular elimination of H<sub>2</sub> and [Au] to give cycloadducts **2**.
