# Duodenal Mycobacterium genavense infection in a patient with acquired immunodeficiency syndrome

**Fig. 1** Endoscopic view in the second portion of the duodenum in a 23-year-old man with known human immunodeficiency virus (HIV) infection showing widespread yellowish white nodules like xanthelasma.

Mycobacterial infection is sometimes fatal in patients with acquired immunodeficiency syndrome (AIDS). *Mycobacterium genavense*, a rare pathogen identified in 1992, causes about 10% of disseminated nontuberculous mycobacterial infections in patients with AIDS and mainly involves the small intestine [1–3]. The endoscopic findings of intestinal *M. genavense* infection are known to be nodules with a velvety appearance that is similar to that seen with *Mycobacterium avium-intracellulare* (*M. avium* complex [MAC]) [4].

A 23-year-old homosexual man with known human immunodeficiency virus (HIV) infection and a past history of hepatitis B and syphilis infections was referred to our hospital. Laboratory tests revealed his HIV RNA level to be  $1.6 \times 10^5$  copies/mL and his CD4 count to be 11 cells/µL. He was admitted 2 months later with intermittent fever, general fatigue, and dry cough. A computed tomography (CT) scan of his chest showed a ground-glass appearance, suggestive of pulmonary infection.

A routine esophagogastroduodenoscopy performed 2 days after admission revealed widespread yellowish white nodules like xanthelasma in the second portion of the duodenum (**Fig. 1**). Pathological exami-

nation of the biopsy specimen showed an accumulation of macrophages in the lamina propria and submucosal layer (**Fig. 2**). Ziehl–Neelsen staining demonstrated numerous acid-fast bacteria being phagocytosed by macrophages (**Fig. 3**). Cultures of bronchoalveolar lavage fluid and blood also detected acid-fast bacteria, which were finally identified as *M. genavense* by DNA amplification techniques. On the basis of these results, the patient was diagnosed as having disseminated *M. genavense* infection. Despite treatment with azithromycin, ethambutol, and levofloxacin, he died of respiratory failure.
