Fitz-Hugh–Curtis syndrome in a man

A 45-year-old man was admitted for pain in the upper right abdominal quadrant that had been evolving for months. His previous medical history was unremarkable. The physical examination showed a painful and tense abdomen in the right hypochondrium but the rest was pain free. Biological analysis showed an inflammatory syndrome (C-reactive protein 29.54 mg/L). Liver enzymology and urine analysis showed an increased medium remained negative. Peritoneal lavage and literature review. Case Rep Surg 2012, article ID 457272
