Candy-like sign during endoscopic ultrasound-guided choledochoduodenostomy as an indication of the long distance between the bile duct and duodenal wall

Endoscopic ultrasound-guided choledochoduodenostomy (EUS-CDS) using a covered self-expandable metallic stent (SEMS) is an established alternative drainage technique for patients in whom endoscopic retrograde cholangiopancreatography has failed [1,2]. This report describes the case of a patient who underwent successful EUS-CDS with a partially covered SEMS placed far from the duodenal wall. A 66-year-old man with locally advanced pancreatic head cancer was admitted to our hospital. He had undergone percutaneous transhepatic biliary drainage (PTBD) at another hospital 1 week earlier because of failed selective bile duct cannulation. He experienced right flank pain after PTBD. As the patient wanted the PTBD tube removed, we opted to perform EUS-CDS rather than antegrade stenting. After puncture of the common bile duct from the first part of the duodenum using a 19-gauge needle (Echo Tip Ultra; Cook Japan, Tokyo, Japan), a 0.025-inch guidewire (VisiGlide; Olympus Medical Systems Corp., Tokyo, Japan) was inserted into the intrahepatic bile duct. Fistula dilation was then performed using a 6-Fr wire-guided diathermic dilator (Cysto-Gastro-Set; Endo-Flex GmbH, Voerde, Germany) with a blended cut mode. Insertion of a partially covered SEMS (WallFlex, 10×60mm; Boston Scientific Japan, Tokyo, Japan) was then attempted through the fistula. The EUS-CDS procedure was performed quickly; however, the SEMS revealed a candy-like sign in the form of a large gap between the bile duct and duodenum, and this sign warrants caution as it indicates distal migration and bile leakage (Fig. 1 and Video 1). We therefore attempted additional stenting using a fully covered SEMS (Bonastent, 10×60mm; Standard Sci Tech, Seoul, Korea), but this stent could not be passed through the first partially covered stent. Balloon dilation (Hurricane RX Biliary Bal-
loon Dilation Catheter; Boston Scientific Japan) of the first partially covered SEMS was performed (Video 1). Finally, a second fully covered SEMS was placed across the fistula through the first partially covered stent without any complication (Fig. 4 and Fig. 5; Video 1). We were successful in saving this patient using placement of an additional fully covered SEMS. Caution should be taken in the event of the rare and dangerous candy-like sign, which indicates a long distance between the bile duct and duodenum, during EUS-CDS with covered SEMS placement.
