Highly Diastereo- and Enantioselective Silver-Catalyzed Double [3+2] Cyclization of α-Imino Esters with Isocyanoacetate

Significance: The authors present a double [3+2] cyclization of α-amino esters with isocyanates to produce highly functionalized oxazole-imidazoles. Therefore, a silver oxide quinine derived amino phosphine ligand was used. For the pioneering work regarding isocyanates using a gold catalyst, see: Y. Ito, M. Sawamura, T. Hayashi J. Am. Chem. Soc. 1986, 108, 6405–6406.

Comment: Kinetic studies identified two cyclization processes to be step-wise. The intermediates, mono-[3+2] cyclization products, were isolated. The products can be hydrolyzed to yield functionalized α,β-diamino esters.

**Silver-Catalyzed [3+2] Cyclization of α-Imino Esters with Isocyanoacetate**

Selected examples:

99% yield, 98% ee  
61% yield, 99% ee  
76% yield, 95% ee  
69% yield, 37% ee

Isolation of intermediates and three-component reaction:

92% yield, dr > 20:1, 99% ee

Synthesis of the α,β-diamino ester:

95% ee  
90% yield, 96% ee
