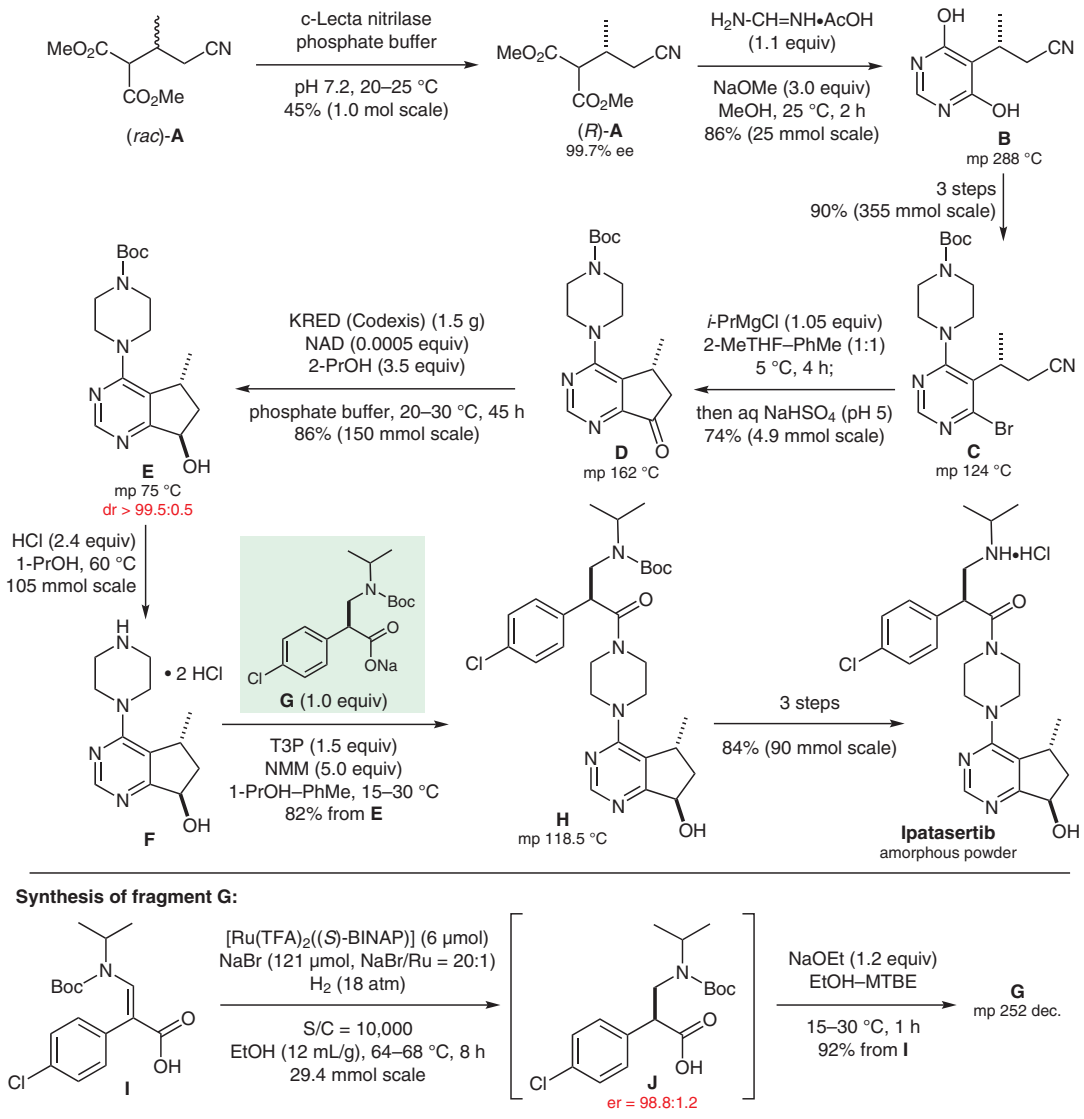
Asymmetric Synthesis of Akt Kinase Inhibitor Ipatasertib
Org. Lett. **2017**, *19*, 4806–4809.

Asymmetric Synthesis of Ipatasertib



Significance: Ipatasertib (GDC-0068) is an Akt kinase inhibitor that that is of interest for the treatment of cancer. The stereogenic centers in fragment **F** were installed using a nitrilase-catalyzed resolution of nitrile (*rac*)-**A** and a ketoreductase-catalyzed reduction of ketone **D**. For a related large-scale synthesis of Ipatasertib, see: T. Remarchuk et al. *Org. Process Res. Dev.* **2014**, *18*, 1652.

Comment: The stereogenic center in fragment **L** was installed by asymmetric hydrogenation. Using [Ru(TFA)$_2$((*S*)-BINAP)] with catalyst activation by NaBr as an additive, allowed for S/C = 10,000. The optimal ratio to ensure reaction robustness was Ru/NaBr = 1:20 and thus afforded >99% conversion and 98.8:1.2 er.
