**Abstract** A new series of etodolac-1,3,4-oxadiazole-1,2,3-triazole derivatives was designed and synthesized from commercially available starting materials by employing a simple synthetic sequence. The in vitro evaluation of the synthesized analogues displayed promising cytotoxic activity. Among the tested compounds **7c**, **7l**, and **7n** exhibited highest cytotoxic activity against MCF-7 (breast), A549 (lung), and DU-145 (prostate) human cancer cell lines.

**Key words** synthesis, etodolac, oxadiazoles, triazoles, cytotoxicity

Organic molecules containing 1,3,4-oxadiazole and 1,2,3-triazole nuclei exhibit a broad spectrum of biological properties such as antimicrobial, antitubercular, antiviral, analgesic, and anticancer activities.<sup>1,2</sup> Particularly, the 1,3,4-oxadiazole heterocyclic nucleus has been widely exploited for a spectrum of therapeutic applications such as antibacterial (Furamizole), antihypertensive (Nesapidil), HIV-integrase inhibition (Raltegravir), and anticancer (Zibotentan) treatments (Figure 1).<sup>3</sup>

**Figure 1** 1,3,4-Oxadiazole scaffold containing pharmaceuticals

Similarly, the 1,2,3-triazole scaffold is found in pharmaceuticals including the non-nucleoside reverse transcriptase inhibitor *tert*-butyldimethylsilylspiroaminooxathiole-dioxide (TSAO) and the anticancer drug (carboxyamidotriazole, CAI) (Figure 2).<sup>4,5</sup> These heterocyclic scaffolds possess specific properties such hydrogen bonding capability, moderate dipole character and molecular rigidity, and can be constructed through a 'click' chemistry approach.<sup>6</sup>

**Figure 2** 1,2,3-Triazole scaffold containing pharmaceuticals

Etodolac (**1**) is a nonsteroidal anti-inflammatory drug used for the treatment of the symptoms of rheumatoid arthritis and osteoarthritis.<sup>7</sup> It has also been found to exhibit potent antitumor activity against various human cancer cell lines.<sup>8</sup> Recent studies revealed that etodolac is a selective COX-2 inhibitor, suppressing proliferation and inducing apoptosis in prostate cancer cells with no effect on normal prostate stromal cells.<sup>9</sup> A literature review suggested that the derivatization of the carboxylate functional group of nonsteroidal anti-inflammatory drugs can result in reduced ulcerogenic potential with retained anti-inflammatory activity.<sup>10</sup> During the last few decades, various etodolac congeners have been evaluated for their biological activities, including anticancer activity.<sup>11</sup> Very recently, our research group has reported the synthesis of a novel series of 1,2,3-triazole-etodolac derivatives and evaluated their anticancer activity.<sup>12</sup> Most of these compounds exhibited potent anticancer activity against A549 human lung cancer cell lines.

In recent years, it has also been reported that the incorporation of the 1,2,3-triazole moiety with 1,3,4-oxadiazoles in a single molecule provides promising biological activities.<sup>13</sup> Therefore, combining etodolac with 1,3,4-oxadiazole and substituted 1,2,3-triazole is predicted to give novel molecules with good cytotoxic activities. In this context, we herein report an efficient synthesis of a series of etodolac derivatives, linking as key fragments 1,3,4-oxadiazole and 1,2,3-triazole scaffolds (Figure 3). The cytotoxic activity of a series of etodolac-1,3,4-oxadiazole-1,2,3-triazoles was based on IC<sub>50</sub> values obtained against MCF-7 (breast), A549 (lung), and DU-145 (prostate) human cancer cell lines.

**Figure 3** Design of etodolac-1,3,4-oxadiazole-1,2,3-triazole derivatives

The target etodolac-1,3,4-oxadiazole-1,2,3-triazole derivatives **7a–o** were synthesized from commercially available etodolac (**1**) via a conventional five-step sequence as depicted in Scheme 1 and Table 1. The known intermediate etodolac-hydrazide **3** was prepared from etodolac (**1**) according to the previous reported procedure.<sup>11b</sup> Etodolac-hydrazide **3** was transformed into the corresponding 1,3,4-oxadiazole-2-thiol **4** by heating to reflux with carbon disulfide (CS<sub>2</sub>) in ethanolic sodium hydroxide solution.<sup>14</sup> The structure of compound **4** was confirmed based on proton resonances appearing at  $\delta = 13.97$  (s, 1 H) ppm in the <sup>1</sup>H NMR spectrum, indicating the presence of the -SH group. Additionally, the <sup>13</sup>C NMR spectrum showed a signal at  $\delta =$

163.5 ppm, corresponding to one carbon of the oxadiazole ring. A molecular ion peak at  $m/z$  344 [M+H]<sup>+</sup> in the ESI mass spectrum further supported the structural assignment. Next, the key intermediate **5**, with a terminal alkyne, was prepared through reaction of propargyl bromide with compound **4** in dimethylformamide (DMF) using K<sub>2</sub>CO<sub>3</sub> as base at room temperature. The structure of **5** was confirmed by <sup>1</sup>H NMR spectroscopic analysis, indicating the presence of a CH<sub>2</sub> group at  $\delta = 3.41$  ppm and absence of a peak at  $\delta = 13.97$  (s, 1 H) ppm in compound **5**. Additionally, the <sup>13</sup>C NMR spectrum showed signals at  $\delta = 24.02$  ppm due to the CH<sub>2</sub> carbon and terminal alkyne resonances at  $\delta = 79.91$  and 80.61 ppm. Further support was provided by the appearance of a molecular ion at  $m/z$  382 [M+H]<sup>+</sup> in the ESI mass spectrum.

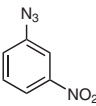

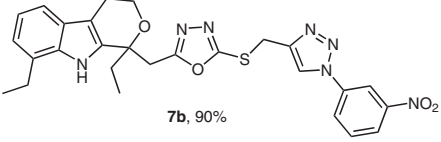

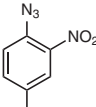

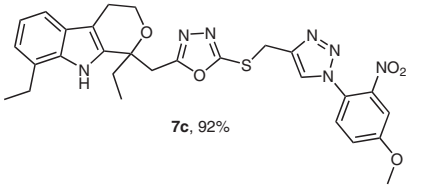

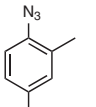

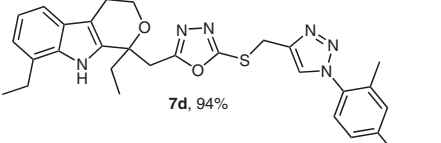

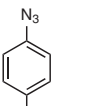

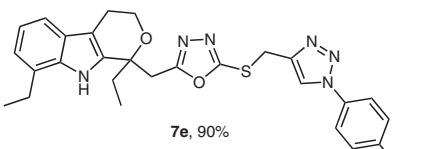

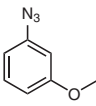

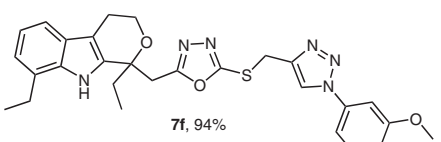

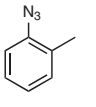

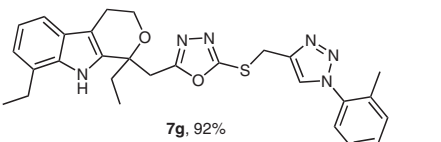

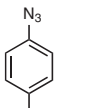

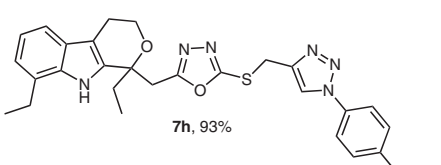

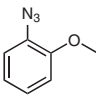

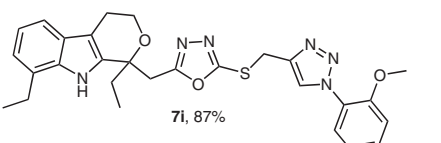

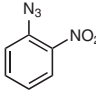

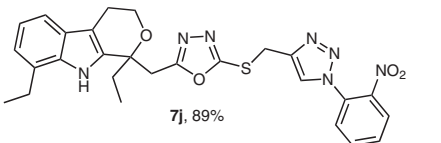

**Scheme 1** Synthesis of etodolac-1,3,4-oxadiazole intermediate

Finally, the 1,2,3-triazole ring of target molecules **7a–o** could be constructed by applying a 'click' reaction. 1,3-Dipolar cycloaddition of **5** with a series of substituted phenyl azides **6a–o** in the presence of CuSO<sub>4</sub>·5H<sub>2</sub>O and sodium L-ascorbate in DMF at room temperature provided the desired target molecules **7a–o** in excellent isolated yields (Table 1).<sup>15</sup> All synthesized compounds were characterized by <sup>1</sup>H NMR, <sup>13</sup>C NMR spectroscopy and mass spectrometry.

The novel etodolac-1,3,4-oxadiazole-1,2,3-triazole derivatives **7a–o** were screened for their in vitro cytotoxicity on three human cancer cell lines, namely MCF-7 (breast), A549 (lung), and DU-145 (prostate), using the MTT (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide) assay. The  $IC_{50}$  values were determined from the plot of percent inhibition (from control) versus concentration; the results are illustrated in Table 2. Doxorubicin was used as a positive control to validate the MTT assay. Compounds **7c**, **7l**, and **7n** showed promising cytotoxicity against all cancer cell lines, with  $IC_{50}$  values ranging from 1.07 to 3.5  $\mu\text{M}$ , among which the derivatives **7c** and **7n** with a methoxy group at the *para*-position of the phenyl ring displayed similar activity against all cancer cell lines. The *para*-methoxy-*ortho*-nitro phenyl derivative **7c** showed the highest potency against both MCF-7 (Breast) and A549 (lung) cancer cell lines, with  $IC_{50}$  values of 1.07  $\mu\text{M}$  and 1.4  $\mu\text{M}$ , respectively. It was observed that, only compounds **7a**, **7c**, **7n**, and **7o** showed promising activity against the DU-145 (prostate) cancer cell line, among which derivative **7o**, with an elec-

tron-withdrawing trifluoromethyl group at the *meta*-position of the phenyl ring, proved to be optimal with an  $IC_{50}$  value of 1.3  $\mu\text{M}$ . The *para*-methoxy-*ortho*-nitro phenyl derivative **7c** showed an  $IC_{50}$  value of 1.5  $\mu\text{M}$ . Compounds **7d**, **7g**, **7k**, and **7m**, possessing electron-donating methyl groups on the phenyl ring, exhibited lower cytotoxic activities.

In summary, we have demonstrated the design, synthesis, and cytotoxic evaluation of a series of novel etodolac-1,3,4-oxadiazole-1,2,3-triazole derivatives against MCF-7 (breast), A549 (lung), and DU-145 (prostate) cancer cell lines. From the initial screening of the tested compounds, it was observed that some of the analogues were active against human cancer cell lines, with  $IC_{50}$  values of  $\leq 15 \mu\text{M}$ . Cytotoxicity profiling indicated that compounds **7c**, **7l**, and **7n** show the best cytotoxicity against all three tested cancer cell lines. Notably, the most active compound **7c** showed a broad range of cytotoxicity in all three cancer cell lines with a remarkable  $IC_{50}$  value of  $1.07 \mu\text{M}$  against the MCF-7 (breast cancer) cell line.

#### 5-((1,8-Diethyl-1,3,4,9-tetrahydropyrano[3,4-*b*]indol-1-yl)methyl)-1,3,4-oxadiazole-2-thiol (**4**)

Etodolac 1,3,4-oxadiazol-2-thione **4** was synthesized from **3** (3 g, 9.93 mmol) by heating to reflux with KOH (14.9 mmol), and  $\text{CS}_2$  (14.9 mmol) in absolute EtOH (30 mL) for 8 h. After completion, the reaction mixture was cooled to r.t. and diluted with ice water (30 mL). Acidification with 1N HCl with stirring formed a precipitate, which was filtered and dried to give **4**.

Yield: 2.9 g (80%); white solid; m.p. 149–153 °C.

FTIR: 3372 (indole), 1250 (C–O–C oxadiazoles stretch), 2549 (SH)  $\text{cm}^{-1}$ .

$^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ):  $\delta$  = 0.72 (t,  $J$  = 7.33 Hz, 3 H), 1.33 (t,  $J$  = 7.33 Hz, 3 H), 1.84–1.99 (m, 1 H), 2.05–2.20 (m, 1 H), 2.62–2.95 (m, 4 H), 3.28–3.44 (m, 2 H), 3.90–4.11 (m, 2 H), 6.91–7.04 (m, 2 H), 7.29 (d,  $J$  = 7.69 Hz, 1 H), 10.07 (s, 1 H), 13.97 (br s, 1 H).

$^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ ):  $\delta$  = 7.11, 13.65, 21.47, 23.49, 30.49, 33.82, 60.20, 75.26, 108.03, 115.02, 118.60, 119.54, 125.45, 126.33, 134.03, 134.35, 160.52, 171.84.

#### 1,8-Diethyl-1-((5-((prop-2-yn-1-ylthio)-1,3,4-oxadiazol-2-yl)methyl)-1,3,4,9-tetrahydropyrano[3,4-*b*]indole (**5**))

Etodolac 1,3,4-oxadiazol-2-thione **4** (3 g, 8.74 mmol) was added to a mixture of propargyl bromide (0.44 mL, 4.91 mmol) and  $\text{K}_2\text{CO}_3$  (1.5 g, 10.5 mmol) in DMF (30 mL) at r.t. and the mixture stirred for 8 h. The reaction mixture was dissolved in water, extracted with diethyl ether, and the organic extract was dried over  $\text{Na}_2\text{SO}_4$  and filtered. The filtrate was evaporated to give **5**.

Yield: 2.7 g (81%); white solid; m.p. 103–105 °C.

FTIR: 3370, 3271 (indole and hydrazone NH), 3324 (mono-substituted alkyne)  $\text{cm}^{-1}$ .

$^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ):  $\delta$  = 0.82 (t,  $J$  = 7.31 Hz, 3 H), 1.36 (t,  $J$  = 7.58 Hz, 3 H), 1.94–2.05 (m, 1 H), 2.11–2.21 (m, 1 H), 2.35 (t,  $J$  = 6.23 Hz, 1 H), 2.74–2.91 (m, 4 H), 3.41 (s, 2 H), 3.61 (d,  $J$  = 6.25 Hz, 2 H), 3.98–4.15 (m, 2 H), 6.99–7.10 (m, 2 H), 7.36 (d,  $J$  = 7.58 Hz, 1 H), 9.10 (br s, 1 H).

$^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ ):  $\delta$  = 7.48, 13.66, 22.21, 24.02, 30.88, 34.76, 60.85, 75.38, 79.91, 80.61, 109.01, 115.85, 119.67, 120.49, 126.02, 22.6, 126.73, 134.73, 163.14, 165.92.

ESI-MS:  $m/z$  = 382 [M + H].

#### Synthesis of Etodolac-1,3,4-oxadiazole-1,2,3-triazole Derivatives **7a–o**; General Procedure

Terminal alkyne **5** was coupled with arylazide **6a–o** using  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$  (0.049 g, 0.2 mmol) and sodium L-ascorbate (0.039 g, 0.2 mmol) in DMF at r.t. for 20–30 min to afford the desired compounds **7a–o** in good to excellent yields. The reaction was found to be complete within 20–30 min, although no ultrasound or microwave irradiation was used.

#### 1-((5-(((1-(4-Bromophenyl)-1H-1,2,3-triazol-4-yl)methyl)thio)-1,3,4-oxadiazol-2-yl)methyl)-1,8-diethyl-1,3,4,9-tetrahydropyrano[3,4-*b*]indole (**7a**))

Yield: 0.129 g (86%); white solid; m.p. 172 °C.

$^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ):  $\delta$  = 0.80 (t,  $J$  = 7.3 Hz, 3 H), 1.33 (t,  $J$  = 7.6 Hz, 3 H), 1.94–2.02 (m, 1 H), 2.08–2.17 (m, 1 H), 2.72–2.90 (m, 4 H), 3.40 (s, 2 H), 3.99–4.04 (m, 1 H), 4.07–4.13 (m, 1 H), 4.58 (s, 2 H), 7.01 (d,  $J$  = 7.62 Hz, 1 H), 7.07 (t,  $J$  = 7.62 Hz, 1 H), 7.36 (d,  $J$  = 7.62 Hz, 1 H), 7.57–7.61 (m, 2 H), 7.62–7.66 (m, 2 H), 8.12 (s, 1 H), 8.86 (br s, 1 H).

$^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ ):  $\delta$  = 7.24, 13.76, 21.75, 23.70, 26.22, 30.61, 33.77, 60.40, 75.54, 108.14, 115.19, 118.81, 119.77, 120.80, 121.41, 125.63, 126.51, 128.71, 132.33, 134.52, 135.31, 143.50, 159.96, 163.19, 165.12.

ESI-MS:  $m/z$  = 581 [M+2H].

#### 1,8-Diethyl-1-((5-(((1-(3-nitrophenyl)-1H-1,2,3-triazol-4-yl)methyl)thio)-1,3,4-oxadiazol-2-yl)methyl)-1,3,4,9-tetrahydropyrano[3,4-*b*]indole (**7b**))

Yield: 0.127 g (90%); pale-yellow solid; m.p. 130–132 °C.

$^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ):  $\delta$  = 0.79 (t,  $J$  = 7.33 Hz, 3 H), 1.33 (t,  $J$  = 7.58 Hz, 3 H), 1.91–2.03 (m, 1 H), 2.07–2.18 (m, 1 H), 2.70–2.91 (m, 4 H), 3.42 (s, 2 H), 3.98–4.14 (m, 2 H), 4.60 (s, 2 H), 7.00 (d,  $J$  = 7.2 Hz, 1 H), 7.05 (t,  $J$  = 7.5 Hz, 1 H), 7.34 (d,  $J$  = 7.7 Hz, 1 H), 7.72 (t,  $J$  = 8.1 Hz, 1 H), 8.10–8.14 (m, 1 H), 8.27 (s, 1 H), 8.28–8.32 (m, 1 H), 8.57–8.61 (m, 1 H), 8.83 (br s, 1 H).
