Abstract

Objectives  This video demonstrates the transcanal transpromontorial approach for resection of vestibular schwannoma.

Design/Setting/Participants  Present study is based on a video of a single patient undergoing the above approach at a tertiary care skull base surgery program.

Results  This video demonstrates a transcanal microscopic transpromontorial approach for resection of an enlarging intracanalicular vestibular schwannoma in a young patient with nonserviceable hearing. The video highlights the pertinent surgical anatomy and outlines, in a step-by-step fashion, the approach to the internal auditory canal via this minimally invasive approach. The surgical indications and reconstructive techniques are also discussed (►Fig. 1).

Conclusions  A transcanal microscopic transpromontorial approach for vestibular schwannoma is feasible and offers a minimally invasive option for patients electing for microsurgical resection.
