Partially insulated cutting instruments for hybrid endoscopic submucosal dissection – the Flat Adenoma Resection Instruments (FARIn)

The endoscopic resection of colorectal polyps that are limited to the mucosa is a well established procedure. Nevertheless, modern imaging technology and screening programs have increased the detection of benign but large (>20 mm) polyps. In flat laterally spreading tumors (LST), especially the nongranular (NG) type, the rate of submucosal invasion is found to be as high as 39% (34%–44%) [1]. For this reason a resection in one piece is mandatory [2].

We report on the resection of a 25-mm flat rectal LST–NG in a 60-year-old patient who was admitted to the Klinikum Augsburg after screening colonoscopy (Fig. 1). Examination with a high definition colonoscope (CF-HQ 190; Olympus Medical Systems, Tokyo, Japan) demonstrated a Sano Type II, pit pattern III lesion. We decided to use two newly developed devices, the Flat Adenoma Resection Instruments (Endox-Feinmechanik GmbH, Bad Urach, Germany). Submucosal injection was performed using a mixture of saline, epinephrine (1:100000), glycerol. Resection of the rectal tumor using the Flat Adenoma Resection Instruments (FARIn; Endox-Feinmechanik GmbH, Bad Urach, Germany). a, d Hybrid endoscopic submucosal dissection using the FARIn Type I: 1 = catheter sheath; 2 = the rhomboid-shaped and electrically isolated section; 3 = the 1-mm tooth at the distal end, used for circular incision (a). b, e The specimen could be resected using the partially insulated snare (FARIn Type C): 1 = catheter sheath; 2, 3 = electrically isolated section of the device; 4 = the 15-mm cutting wire at the distal tip of the snare; 5 = the tip of the snare is isolated in order to protect the organ wall from injury; 7, 8 = The colored markings on the snare allow the cutting speed to be visualized when the snare is closed. c Resected specimen mounted onto cork, showing the adenoma in the center of the mucosa.
(10%), and a small amount of indigo carmine solution. Circumferential incision was performed using the FARIn Type I, a rhomboid-shaped device with a small 1-mm cutting tooth at the distal tip. A high frequency generator (VIO 300 D; Erbe, Tübingen, Germany) was configured to AUTO CUT 300W and FORCED COAG 30W. After circumferential incision, the specimen could be resected en bloc using the FARIn Type C, a symmetric snare with a cutting wire length of 15 mm (● Fig. 2, ● Video 1).

The histopathological examination showed an adenoma with high grade dysplasia, and an adherent submucosal layer to a depth of >1000µm under the entire lesion (● Fig. 3). In summary, the FARIn instruments allowed the en bloc resection of a large (>20mm) LST-NG with adherent submucosal layer (>1000µm), which meets the specimen requirements for pathological complete resection (R0).

Competing interests: Dr. Farin is the inventor of the FARIn devices.
