Abstract

Fetal double aortic arch (DAA) is a rare congenital arch anomaly characterized by the presence of two aortic arches instead of the normal single arch. DAA is an uncommon finding during routine fetal echocardiography. Prenatal ultrasound detection of fetal DAA is crucial for early identification and appropriate management of affected fetuses. Despite the challenges and limitations, advancements in imaging technology and expertise have improved diagnostic accuracy.

Keywords

- 4D ultrasound
- arch anomaly
- double aortic arch
- fetal echocardiography
- STIC

In ►Fig. 1, The three-dimensional view of the fetal heart is shown with depiction of a double aortic arch without labeling the relevant structures, whereas ►Fig. 2 labeled relevant structures.
